

GENUINE LEATHER CARE SHEET

What To Do When Your Covers Get Wet

Although our leather covers are water-resistant, you still need to be careful with exposing them to water. If you get excess water on your covers, use a dry cloth, and lightly dab any moisture that has pooled on the leather. Try your best to not rub it in as this will just push more water into your covers. Afterwards, let your covers dry naturally.

Do not use any type of heat source on your covers to dry them. This includes using a blow dryer, leaving your leather covers on a heat vent, or leaving your covers outside in direct sunlight. Heat can cause even more damage than water and will leave your covers with a dry cracked leather look.

How To Maintain Your Covers

It's extremely important to condition your covers every 6 months to increase their longevity. If you live in warmer, dry climates, you may need to condition them more often. Be careful not to over condition as this can lead to your menu covers feeling tacky or sticky.

If you're in need of a leather conditioner, we recommend using MooBuzz, which is made from beeswax and neatsfoot oil. The beeswax helps make your covers more water-resistant, and the neatsfoot oil moisturizes and softens the leather. To apply the MooBuzz, you can either use your hands or a clean, soft cloth. Once you apply the balm and it has been absorbed into your covers, give them a quick buff with a dry cloth.

If you have any other questions regarding caring for your leather menu covers, give us a call or email us at info@hrisch.com.
